PAPER

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

<b>Office Action Summary</b>	<b>Application No.</b> 10/674,669	<b>Applicant(s)</b> TREMBLAY ET AL.	
	<b>Examiner</b> LOIS ZHENG	<b>Art Unit</b> 1793	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 12 February 2010.
- 2a) ☒ This action is **FINAL**.                      2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 17 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 17 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## **DETAILED ACTION**

### ***Status of Claims***

1. Claim 16 is canceled in view of applicant's response filed 12 February 2010.  
Therefore, claim 17 is currently under examination.

### ***Claim Interpretation***

2. Since applicant's invention includes a non-membrane electrolysis cell that further comprises a non-conducting porous flow barrier, the examiner interprets the language "non-membrane electrolysis cell" to mean an electrolysis cell that does not include an ion-selective membrane. The "non membrane electrolysis cell" as recited in claims 16-17 does not exclude other porous membranes/separator/barrier/diaphragm/spacer that is not ion-selective or ion-conducting.
3. The term "non-conducting porous flow barrier" as recited in claim 17 is interpreted to mean a porous barrier/separator/spacer/membrane/diaphragm that is not electrically conducting and/or ionically selective/conducting and is capable of restricting flow of electrolyte in an electrolysis cell.

### ***Claim Rejections - 35 USC § 103***

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Art Unit: 1793

5. Claim 17 is rejected under 35 U.S.C. 103(a) as being unpatentable over Buckley et al. US 6,632,347 B1(Buckley), and further in view of Kaczur et al. US 5,106,465 (Kaczur).

Buckley teaches an electrochemical apparatus comprising a concentrated salt solution tank(i.e. reservoir) that supplies concentrated salt solution to process water stream to locally form the electrolyte feed solution to the electrolyzer(Fig. 2 #20, col. 19 line 64 - col. 20 line 49). Buckley further teaches using a peristaltic pump for pumping the concentrated salt solution to the process water stream forming feed stream to the electrolyzer(col. 20 lines 41-45, Fig. 2). Buckley's electrolyzer comprise an anode, a cathode, a porous ceramic semi-permeable separator(i.e. non-conducting porous flow barrier) separating the anode and the cathode, an inlet for receiving the feed solution and an outlet for discharging effluent(col. 14 lines 34-41). The electrolyzer of Buckley further comprises a passage of feed solution adjacent to the anode and an electric current supply providing current to the electrolysis cell.

Regarding claim 17, Buckley teaches that is porous ceramic semi-permeable separator can be used as an alternative to an ion-selective membrane(col. 14 lines 34-65). Therefore, the examiner concludes that Buckley's is porous ceramic semi-permeable separator is not ion-selective membrane and an embodiment of Buckley's teaching is a non-membrane electrolysis cell as claimed(i.e. an electrolysis cell without an ion-selective membrane). The porous ceramic semi-permeable separator as taught by Buckley reads on the claimed non-conducting porous flow barrier. Buckley further teaches that its anode is a titanium anode(col. 14 lines 25-27).

In addition, the claimed halogen dioxide feed solution and the halogen dioxide salt are directed to material being worked on by the claimed apparatus, therefore, do not render the instant apparatus claims patentable. See MPEP 2115.

However, Buckley does not explicitly teach that the metal anode is porous.

Kaczur also teaches an electrolytic cell for the generation of chlorine dioxide (abstract). Kaczur further teaches the use of a porous platinum coated titanium anode(col. 4 lines 41-63).

Regarding claim 17, it would have been obvious to one of ordinary skill in the art to have incorporated the porous platinum coated titanium anode of Kaczur into the electrolytic apparatus of Buckley in order to utilize the high surface contact area due to the porosity of the anode and achieve high corrosion resistance as taught by Kaczur (col. 4 lines 44-45 and 57-60).

The porous anode of Buckley in view of Kaczur comprises a plurality of porous flow passages through which at least a portion of the aqueous feed solution flows. In addition, since the direction of electricity in the electrolysis cell of Buckley travels horizontally between the anode and the cathode chamber(Fig. 2 #62,64), the inlet to the electrolysis cell locates at the bottom of the electrolysis cell and the outlet locates at the top of the electrolysis cell, the examiner concludes that the electrolyte electrolysis cell of Buckley in view of Kaczur flows in a cross direction to the flow of electricity between the anode and cathode chambers as claimed. Buckley further teaches claimed return passage for recycling of feed as claimed (Fig. 2 # 126, col. 24 lines 4-10).

Art Unit: 1793

6. Claim 17 is rejected under 35 U.S.C. 103(a) as being unpatentable over Kelley US 6,306,281 B1(Kelley) and Buckley, and further in view of Kaczur.

Kelley teaches an electrolytic apparatus for the generation of chlorine dioxide(abstract). The apparatus comprises an aqueous sodium chlorite feed solution(col. 2 lines 55-61), a non-membrane electrolysis cell comprising an anode, a cathode, an inlet, an outlet(Fig. 1) and a power source connected to the anode and the cathode(col. 3 lines 18-21), thereby providing current through the aqueous feed solution.

Regarding claim 17, the inlet and the gap between the anode and the cathode of Kelley reads on the claimed passage for the feed solution adjacent to the anode. The inlet in the electrolytic apparatus of Kelley is capable of receiving aqueous feed solution stream and the outlet in the apparatus of Kelly is capable of discharging halogen dioxide containing effluent as claimed.

In addition, the claimed halogen dioxide feed solution is directed to a material that is worked on by the instantly claimed apparatus. As stated in MPEP 2115, it is well settled that "[i]nclusion of material or article worked upon by a structure being claimed does not impart patentability to the claims." *In re Young*, 75 F.2d 996, 25 USPQ 69 (CCPA 1935) (as restated in *In re Otto*, 312 F.2d 937, 136 USPQ 458, 459 (CCPA 1963)).

However, Kelley does not explicitly teach that the claimed means for delivering halogen dioxide salt directed to an aqueous feed solution inlet stream to locally form the

Art Unit: 1793

aqueous halogen dioxide feed solution. Kelley also does not explicitly teach the claimed non-conducting porous flow barrier.

Buckley teaches an electrochemical apparatus comprising a concentrated salt solution tank(i.e. reservoir) that supplies concentrated salt solution to process water stream to locally form the electrolyte feed solution to the electrolyzer(Fig. 2 #20, col. 19 line 64 - col. 20 line 49). Buckley further teaches using a peristaltic pump for pumping the concentrated salt solution to the process water stream(col. 20 lines 41-45).

Regarding claim 17, it would have been obvious to one of ordinary skill in the art to have incorporated the electrolyte feeding mechanism of Buckley into the inlet stream of Kelley in order to monitor and control the flow of the feed solution and to maintain the concentration of the feed solution as taught by Buckley.

Therefore, the apparatus of Kelley in view of Buckley comprises the claimed means for delivering halogen dioxide salt directly into an aqueous feed solution inlet stream to locally form the aqueous feed solution as claimed. In addition, since the apparatus of Kelley in view of Buckley is structurally the same as the claimed halogen dioxide generating system, one of ordinary skill in the art would have found it obvious that the apparatus of Kelley in view of Buckley is capable of consume power at about one Watt or less as claimed.

Buckley further teaches that a semi-permeable porous ceramic separator (i.e. non-conducting porous flow barrier) is placed between the anode and cathode of the electrolysis cell in order to achieve an adequate flow of solution between the anode and the cathode chambers to provide acceptable electrical resistance while being sufficiently

Art Unit: 1793

non-permeable to prevent gross mixing of anolyte and catholyte (col. 24 lines 44-65).

Buckley further teaches the claimed return passage for returning the depleted effluent back to the source(Fig. 2 # 126).

Regarding claim 17, it would have been obvious to one of ordinary skill in the art to have incorporated the porous ceramic separator (i.e. non-conducting porous flow barrier) as taught by Buckley into the electrolytic cell of Kelley in view of Buckley in order to achieve an adequate flow of solution between the anode and the cathode chambers to provide acceptable electrical resistance while being sufficiently non-permeable to prevent gross mixing of anolyte and catholyte as taught by Buckley. In addition, one of ordinary skill in the art would also have found it obvious to incorporate the return passage for depleted effluent back to feed stream as taught by Buckley into the apparatus of Kelley in view of Buckley in order to reduce operating cost and increase efficiency by recycling electrolyte.

Therefore, the porous ceramic separator in the apparatus of Kelley in view of Buckley reads on the claimed non-conducting porous flow barrier. In addition, the apparatus of Kelley in view of Buckley comprises the claimed passage.

However, Kelley in view of Buckley do not explicitly teach that the metal anode is porous.

Kaczur also teaches an electrolytic cell for the generation of chlorine dioxide (abstract). Kaczur further teaches the use of a porous platinum coated titanium anode(col. 4 lines 41-63).

Regarding claim 17, it would have been obvious to one of ordinary skill in the art to have incorporated the porous platinum coated titanium anode of Kaczur into the electrolytic apparatus of Kelley in view of Buckley in order to utilize the high surface contact area due to the porosity of the anode and achieve high corrosion resistance as taught by Kaczur (col. 4 lines 44-45 and 57-60).

In addition, the porous anode of Kelly in view of Buckley and Kaczur is capable of allow at least a portion of the aqueous feed solution flows in a cross direction to a flow of electricity between the anode and the cathode as claimed. Furthermore, the porous ceramic separator as taught by Kelly in view of Buckley and Kaczur is non-conductive and is capable of restricting flow of the electrolyte solution in a cross direction to the flow of electricity between the anode and the cathode as claimed.

### ***Response to Arguments***

7. Applicant's arguments filed 12 February 2010 have been considered but they are not persuasive.

In the remarks, applicant argues that Buckley does not teach the use of a controlled release tablet as claimed.

The examiner does not find applicant's argument persuasive because instant claim 17 recites that the means for locally delivering halogen dioxide salt to a feed solution comprise "**one or** more of" techniques i), ii) and iii). Using controlled release tablet is only listed as option iii) of the three techniques. Any apparatus that utilizes one of these three techniques as well as satisfying all other structural limitations of the instant claim 17 would read on the claimed apparatus. Buckley teaches using a

Art Unit: 1793

concentrated salt solution tank(i.e. reservoir) that supplies concentrated salt solution to process water stream, which reads on the claimed technique i). In addition, Buckley in view of Kaczur disclose an apparatus that is structurally the same as the claimed apparatus. Therefore, the examiner maintains that the rejection is proper.

Applicant further argues that Buckley does not disclose the claimed recycling that reuses the reverted halogen dioxide salt.

The examiner does not find applicant's argument convincing because Buckley teaches that the output solution from the storage tank 78, which stores output solution from the electrolytic cell, can be routed via valve 126 to filled the process water tank 14, then pumped by pump 44 through the electrolytic cell pack into the weir tank 70(col. 24 lines 4-10). Therefore, at least part of the output solution from the electrolytic cell in the apparatus of Buckley is recycled back through the electrolytic cell, wherein the solution would have been reused.

Applicant further argues that Kelley is designed for "up-flow" and does not disclose the claimed recycle or use of a controlled release tablet.

The examiner does not find applicant's argument persuasive. Kelley's "up-flow" design is irrelevant because the instant claim does not recite any features that would limit the claimed apparatus to a down-flow design. In addition, Buckley's concentrated salt solution feeding mechanism has been incorporated into the teaching of Kelley to address the claimed means for locally delivering the salt solution to the feed stream, which reads on the claimed technique i). Furthermore, Buckley's return passage has also been incorporated into Kelley's apparatus in the rejection ground to address the

Art Unit: 1793

claimed recycle passage. Therefore, the examiner maintains that the combination of Kelley in view of Buckley and Kaczur disclose an apparatus that is structurally the same as claimed.

### ***Conclusion***

8. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to LOIS ZHENG whose telephone number is (571) 272-1248. The examiner can normally be reached on 9:00am - 5:30pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Roy King can be reached on (571) 272-1244. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
